

GROW KIT INSTRUCTIONS FROM HOME

MICRODOSE BROS.

1

Thoroughly wash your hands with clean water and use a dry cloth to clean the exterior part of the grow kit. Once this is done, you can remove the lid and move on to the next step.

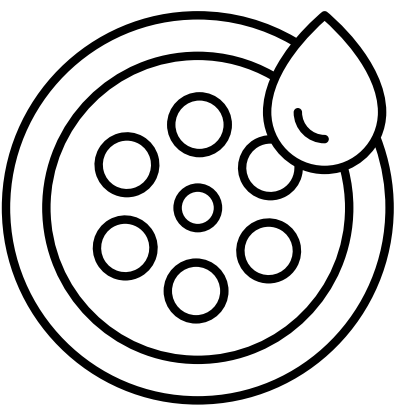

Use lukewarm water (20 degrees) to fill the grow kit to the edge. Place the lid on the grow kit again and allow for 5 minutes to soak.

2

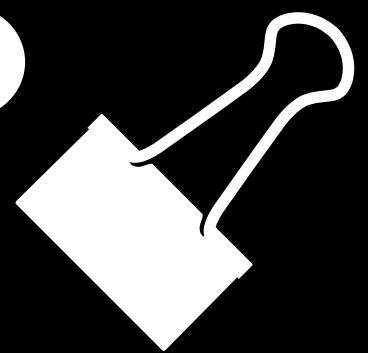

3

Remove the lid and drain the water from the grow kit. Leave it for 10 seconds to drain completely.

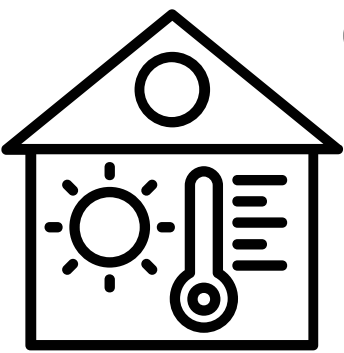

4

Place the grow kit inside the grow bag and add a cup of lukewarm water to fill the grow bag. Use 2 paper clips to close the bag after folding its top.

5

Place the grow kit under average room temperature conditions, and also be careful not to place it not directly under sunlight. It should also not be near a heat source or under a lamp.

Let some fresh air into the grow bag. This should be done daily and only for a few minutes. You'll also need to use a misting bottle to moisten the grow kit.
